February 8, 2024

# 0.1 MF 728: Fixed Income

## 0.1.1 Problem set # 1

1. Yield Curve Construction: Consider the following table of USD swap rates:

Term	Rate (%)
1Y	2.8438
2Y	3.060
3Y	3.126
4Y	3.144
5Y	3.150
7Y	3.169
10Y	3.210
30Y	3.237

Note: You may assume that these swaps pay coupons semi-annually (every 6 months). For simplicity, you may use a year fraction of 0.5 in all swap coupon payments.

(a) Extract the constant forward rate for the first year that enables you to match the 1Y market swap rate.

```
[74]: import numpy as np
    from scipy.optimize import fsolve

#

def swap_present_value(f1, sw1):
    # PV
    PV = 0.5 * sw1 / (1 + 0.5 * f1) + 0.5 * sw1 / (1 + 0.5 * f1)**2
    # PV
    return PV - 0.5 * f1 / (1 + 0.5 * f1) - 0.5 * f1 / (1 + 0.5 * f1)**2

# swap_to_forward_1Y args sw1
def swap_to_forward_1Y(sw1):
    # fsolve swap_present_value sw1
    forward_rate = fsolve(swap_present_value, x0=sw1, args=(sw1,))
    return forward_rate[0]
```

```
[75]: f1 = swap_to_forward_1Y(2.8438 / 100) print(f1)
```

0.02843799999999998

(b) Holding this first year forward rate fixed, find the forward rate from one year to two years that enables you to match the two year swap (while also matching the one year).

```
[76]: #
                                            def swap_present_value(f2, sw2, f1):
                                                                         PV1 = sw2 / (1 + 0.5 * f1) + sw2 / (1 + 0.5 * f1)**2 + sw2 / ((1 + 0.5 * f1))**2 + sw2 / ((1 + 0.5 * f1))**3 + s
                                                      _{\circ}f1)**2 * (1 + 0.5 * f2)) + sw2 / ((1 + 0.5 * f1)**2 * (1 + 0.5 * f2)**2)
                                                                         PV2 = f1 / (1 + 0.5 * f1) + f1 / (1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1) **2 + f2 / ((1 + 0.5 * f1

Differences between Zero Rates and Swap Rates:

- Level of Rates: The zero rates and swap rates follow a similar trend up to the 10Y maturity, where zero rates increase with maturity, reflecting a normal upward-sloping yield curve. However, for the 30Y maturity, the zero rate significantly drops compared to the swap rate, indicating a discrepancy in long-term interest rate expectations or market conditions.
- Market Expectations and Liquidity: Swap rates are influenced by the expectations of future
  interest rates, credit risk, and liquidity in the swap market. In contrast, zero rates are purely
  derived from the current market prices of zero-coupon bonds or derived from bond prices,
  reflecting the market's view on future interest rates without the swap market's credit and
  liquidity considerations.
- (f) Shift all forward rates up 100 basis points and re-calculate the breakeven swap rates for each benchmark point. Generate a table of new swap rates. Are these rates equivalent to having shifted the swap rates directly?

}

df = pd.DataFrame(rates)
print("\nOriginal vs Modified Swap Rates:\n")
print(df)
```

## Original vs Modified Swap Rates:

	Term	Original	Modified
0	1	0.0284	0.0384
1	2	0.0306	0.0406
2	3	0.0313	0.0412
3	4	0.0314	0.0414
4	5	0.0315	0.0415
5	7	0.0317	0.0417
6	10	0.0321	0.0421
7	30	0.0324	0.0423

The modified swap rates produced by for\_up\_swr() are equivalent to having directly shifted the swap rates by 0.01 basis points. The end result is the same in both cases.

Shifting the forward rates and recalculating is equivalent to shifting the swap rates directly.

# (g) Consider a bearish steepener to the swap rates, that is perform the following shifts on each swap rate:

Term	Rate change (bps)
1Y	+0
2Y	+0
3Y	+0
4Y	+5
5Y	+10
7Y	+15
10Y	+25
30Y	+50

(i) Consider a bull steepener to the swap rates, that is perform the following shifts on each swap rate:

Term	Rate change (bps)
1Y	-50
2Y	-25
3Y	-15
4Y	-10
5Y	-5
7Y	+0
10Y	+0
30Y	+50

Print the new swap rates.

(j) Re-run your bootstrapping procedure with this new curve. Comment on the changes to the forward rates.

```
